

Project Design Phase

Problem – Solution Fit Template

Date	19 July 2026
Team ID	XXXX XXXX XXXX
Project Name	Ucab – Smart Cab Booking Application
Maximum Marks	2 Marks

Behavior Observed

Riders currently juggle multiple apps or roadside hailing, face unclear pricing, and have no visibility into driver arrival — leading to wasted time and anxiety, especially for time-critical trips such as reaching an airport or office on time.

Existing Alternatives

- Roadside hailing – no fare transparency, unreliable wait time
- Phone-call booking – slow, manual, no live tracking
- Generic ride-hailing apps – often lack simple add-ons like donation/refreshments and clear history

Triggers

- Time-critical trips (flights, meetings, emergencies)
- Uncertainty about fare before committing to a ride
- Not knowing when the cab will actually arrive

Emotions Before / After

Before: anxious, rushed, uncertain about cost and timing. After (with Ucab): reassured by upfront fare & ETA, in control via live tracking, and relieved by automatic hassle-free payment.

Problem – Solution Fit

Ucab directly fits this behavior pattern by consolidating discovery, transparent fare estimation, live tracking and automated payment into a single flow — reducing both the number of steps and the uncertainty riders currently tolerate.
